

New and updated features in the 2017 release:

Request options (Peak height and peak limit)

- An analyst can optionally create requests with a baseline below 10 rfu.
- Updated interface for peak limit; used when considering more than five contributors or lowered baseline data.
- For more information, refer to the Request Module manual section Appendix: Request Options.

Request statistics

- Tools module has two new tables: Status Count and Client Count.
- Status Count provides request status statistics for a TrueAllele World (e.g., Ready, Solving, Done).
- Client Count provides statistics for each client within a World.
- For more information, refer to the Tools Module manual section 3: TrueAllele World.

General

- Extended support for additional naming separators in the database match filter.
- Interface improvements for data sets spanning multiple STR kits.
- Match table displays KL values and mixture weights when no reference genotypes are available.
